

The Language Development Project seeks families with children ages 9-12 years old with unilateral brain injury from an early stroke to join a multi-year study of language learning.

Have you ever wondered how children who had a perinatal stroke use language to think and learn?

Do all children with brain injury learn and use language in the same way?

What are the best ways to help children with unilateral brain injury excel in language and learning?

Your family can help us answer these questions and many more by being part of the Language Development Project.

Earlier in this study, we researched how children with brain injuries learn language. Now, we are looking to understand how children with brain injuries use language to think and learn. Specifically, we are looking for children with unilateral brain injury from an early stroke.

We will visit children in their homes one to two times per year for approximately two hours at each visit. Families will receive \$60 per home visit for participating in the study.
